Baulk Ring Identification

MODELS:MGB With Four Speed Synchromesh
Transmission

There is a material specification difference between the baulk rings used for first/second gears and those used for third/fourth gears. Although the physical dimensions are the same for all four rings, it is essential the correct rings are installed into their respective synchronizer assemblies.

Baulk rings used for first/second gears are identified by an additional fillet of material from the 'V' section of the baulk ring ear to the outside of the cone.

The same identification is used on the MGC transmission with a part number change for the third/fourth baulk ring.
